

## To Transfer Your Existing WordPress Site to a New Location

1. Get a WordPress (WP) Host, such as <http://www.hostmonster.com>
2. Create a new WP website (use one-click install, if available)
3. Install the same themes and plugins from the existing site to the new site
4. Export existing site using Tools/Export in Dashboard
5. Import existing site XML file into new site using Tools/Import in Dashboard

Advanced method: FTP entire WP directory and database to your computer and upload to new location. You will need a program like [MySQL Query Browser](#) to move the database, and you will need to change your wp-config.php file to point it to the new database.
